Incorporating Reflexology into Your Life

Footprints for Health

You walk on them all day, but did you know your feet do more than carry you from one place to the next? They also have a unique connection to balanced health and well-being. In a form of bodywork known as reflexology, the feet are said to contain reflex areas that mirror and connect to all parts of the body--and pressure on these points can actually influence your state of health.

What is Reflexology

The roots of reflexology draw, in part, from the ancient healing art of foot massage, practiced the world over, from Asian and Egyptian civilizations to tribal communities of the Americas. Early archaeological digs have revealed statues

relaxation technique. Using the thumb, finger, and hand, gentle pressure is applied to reflex areas of the feet in order to decrease stress and bring the body into equilibrium. While some reflexologists also apply treatment to the hands and ears, the foot—with its greater quantity of sensitive nerve endings—is considered the most amenable to this approach.

Although simplistic in application, the effects of the treatment can be profound. Through activation of nerve receptors in the hands and feet, new messages flood into the body system, changing its tempo and tone. In essence, the foot or hand becomes a conduit for sharing information throughout the

The foot has a greater quantity of sensitive nerve endings than other body parts.

of Buddha in China and Japan, and Vishnu (a Hindu god) in India, depicting markings of specific areas on the feet. But it has only been within the last century that this work has established a foothold, so to speak, in Western practice.

As we know it today, reflexology is viewed primarily as a stress reduction or

body. Function in the connecting area is improved and, at the same time, the body experiences overall relaxation and benefits to the circulation and elimination systems. When the body's systems are at optimal functioning, self-healing is enhanced.

In this sense, reflexology is not a medical treatment for specific symptoms or diseases, but rather a way to facilitate the body's inherent healing power. Therefore, it stands to reason that paying attention to your feet can also be a great preventive measure and one easily incorporated into a daily routine.

How and why reflexology works the way it does is still up for debate. Some say it involves communication through the nervous system; other theories point to opening blockages of chi, or vital energy, in the body. Regardless, scientific studies have documented its benefit for a variety of ailments, ranging from acute disorders to chronic diseases. The majority of reflexology research has come from China where the technique is commonly used in hospitals homes both $_{
m for}$ health maintenance, and as adjunct to medical care. Some of the positive findings include reduction of pain, improvement in circulation, release of tension, and improved effectiveness of medication, as well as benefits for diabetes and headaches.

Fancy Footwork

Kevin Kunz, author of several reflexology books and codirector of the Reflexology Research Project, emphasizes the importance of making reflexology a part of your life. Consistency is key if you expect results, and foot homework is a low-cost, efficient way to extend the benefits of weekly sessions with your reflexologist. The techniques can be practiced even while you're busy doing something else. You can purchase devices such as foot rollers for use under the desk, but even inexpensive homemade devices will do, Kunz says. "You can put a golf ball in a sock, tie it up, and you have a roller. Anything to cause stimulation has a beneficial effect."

Reflexology is also a safe and effective technique for infants and children, soothing their emotions and promoting sleep. Naturally available and noninvasive, this approach can enhance communication between parent and child and aid in developing the child's physical awareness.

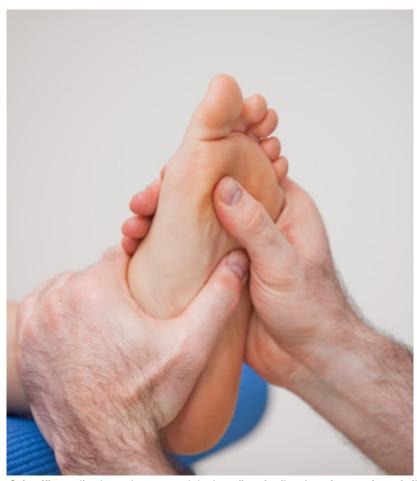

Feedback and Stimulation

According to Kunz, lack of stimulation for the feet is a major problem in our society. We box our feet in shoes and forbid them to traipse the natural environment. Some American feet never even see sunlight, much less travel naked on a forest floor. "The feet carry the body, in more ways than one," Kunz says. "Constant feedback from the feet is needed in order for the body to make the proper responses." There is no challenge for the foot in walking on flat surfaces. Feet crave stimulation, and they were built for a variety of surfaces.

The Japanese, as well as Europeans, have addressed this basic need by creating health pathways to stimulate every part of the foot. "This comes from taki fumi," Kunz says, "to step upon bamboo. Here we call them stroll pathways. The idea is that you stroll along, and as you do, you are strengthening the system. It's great exercise and gives you more endurance."

In Asia, pathways frequently feature cobblestones for stimulation, but a sandy beach or rocky hiking trail can provide variation underfoot.

Whatever path you choose, get off the pavement, free your feet, and let them do their thing. "Over thousands of years," Kunz says, "every culture has discovered it in some shape or form. The foot is it."

Scientific studies have documented the benefits of reflexology for a variety of ailments.

A Walking Workout

Have Fun While Burning More Calories

Imagine the lone hiker, backpack laden with sleeping bag and bedroll, wielding a well-worn walking stick as she climbs the side of a snow-covered mountain. For centuries, trekkers have used walking sticks, partly as a defense against attacking wildlife, partly to aid in balance, and partly as support on long, arduous climbs. But in recent years, many hikers have replaced the single wooden walking stick with hiking poles.

Held in both hands and used to distribute weight more evenly through the four limbs, wilderness hikers have found poles invaluable for safety, efficiency, and comfort on long hikes. What wilderness hikers have known for some time now is that walking poles are a great way to relieve pressure on knees, ankles, and the back. They encourage better posture and provide a total body workout by engaging the upper body.

Now, hiking poles are showing up in urban areas as fitness walkers discover the benefits they provide. Nordic walking--similar in technique to cross-country skiing--is a great way to get a whole body workout, increase oxygen consumption, and burn more calories than regular walking or even speed walking. This total body workout burns 40 percent more calories and consumes 25 percent more oxygen. Poles can be purchased at most outdoor sporting stores, along with rubber tips for use on paved paths.

TECHNIQUE

Adjust your poles to approximately 70 percent of your height and loosely secure the straps around your wrists. Hold the poles at an angle behind you so they propel you forward with a slight bend at the elbow. Use an opposite hand-and-heel motion as you walk--right heel strikes as left pole tip contacts the ground. And you're on your way! Don't be shy with your poles. Remember: You're burning 40 percent more calories.

Add walking poles, and burn more calories.

Massage for Old Injuries

Ancient Injuries Don't Have to Make You Feel Old

Art Riggs

Injuries such as chronic back pain, trick knees, and sticky shoulders are not necessarily something you just have to live with. Massage techniques might hold the key to unlocking this old pain.

Will Massage Help?

The benefits of massage will depend on the extent of the injury, how long ago it occurred, and on the skill of the therapist. Chronic and old injuries often require deeper and more precise treatments with less emphasis on general relaxation and working on the whole body. Massage works best for soft tissue injuries to muscles and tendons and is most effective in releasing adhesions and lengthening muscles that have shortened due to compensatory reactions to the injury. Tight and fibrous muscles not only hurt at the muscle or its tendon, but can also interfere with proper joint

movement and cause pain far away from the original injury.

Therapists who perform such work often have specialized names for their work--such as orthopedic massage, neuromuscular therapy, myofascial release, medical massage, etc.,--but many massage therapists utilize an eclectic approach combining the best of the specialties.

It Works!

A recent Consumer Reports article ran the results of a survey of thousands of its readers and reported that massage was equal to chiropractic care in many areas, including back and neck pain. Massage also ranked significantly higher than some other forms of treatment, such as physical therapy or drugs.

If that nagging injury persists, consider booking a massage. Be sure to discuss the injury with your practitioner: How did you receive the injury? Have you reinjured it? And what exactly are your symptoms? Often, the body compensates in one area to protect another that has been traumatized, and this can create new problems.

Discuss the issues with your massage therapist. (Sometimes just talking about old injuries can play a significant role in the healing process.) Together, the two of you can work to determine a treatment plan.

Experience enriches your heart, mind and soul to a depth nothing can.

-Jennifer Finegold

Getting stuck in your self care routine? Ask if our Individualized Self Care Program is for you! You'll meet one-on-one with Paula, either virtually or at the office, to discuss where you're stuck and how you can get beyond that.
